Innovating Epigenetic Solutions

MicroPlex Library Preparation kit v2

High Performance Library Preparation for Illumina® NGS Platforms

Cat. No. C05010012 (12 rxns, 12 indices)
C05010013 (48 rxns, 12 indices)
C05010014 (48 rxns, 48 indices)

Version 2 I 08.16

Content

Product description

MicroPlex v2 builds on the innovative MicroPlex chemistry to generate DNA libraries with expanded multiplexing capability and with even greater diversity. Kits contain up to 48 Illumina® -compatible indexes. MicroPlex v2 can be used in DNA-seq, RNA-seq, or ChIP-seq and offers robust target enrichment performance with all of the leading platforms.

Kit contents

MicroPlex Library Preparation kit v2 contains sufficient reagents to prepare up to the specified number of reactions. Enough buffers and enzymes are provided for 4 uses or freeze-thaw cycles. Contents of MicroPlex Library Preparation kit v2 are not interchangeable with other Diagenode products.

Table 1: MicroPlex Library Preparation kit v2 contents

Name	Cap color	µl/rxn	12 reactions / 12 indexes	48 reactions / 12 indexes	48 reactions / 48 indexes
Template Preparation Buffer	Red	2	24 µl	96 µl	96 µl
Template Preparation Enzyme	Red	1	12 µl	48 µl	48 µl
Library Synthesis Buffer	Yellow	1	12 µl	48 µl	48 µl
Library Synthesis Enzyme	Yellow	1	12 µl	48 µl	48 µl
Library Amplification Buffer	Green	25	300 µl	1200 µl	1200 µl
Library Amplification Enzyme	Green	1	12 µl	48 µl	48 µl
Nuclease-Free Water	Clear	4	48 µl	192 µl	192 µl
Indexing Reagents Tube*	Blue	5	40 µl	120 µl	/
Indexing Reagent Plate**	/	5	/	/	5 µl

The volumes of buffers and enzymes mentioned above are the minimum volumes required to complete 12 or 48 reactions. However an excess is included in each tube to cover pipetting loss.

* In the case of the 12 Indexing Reagent tubes (**12 rxns**), it allows up to 8 uses of a particular index. In the case of the 12 Indexing Reagent tubes (**48 rxns**), it allows up to 24 uses of a particular index.

** In the case of the Indexing Reagent Plate, it allows a single use of a particular index.

Component volume is target total fill volume to ensure customer can achieve Essential Volume (including pipetting loss; variation in pipettors) in order to perform the specified number of reactions. For every component, we are supplying at least 15% overfill.

Shipping and storage

MicroPlex Library Preparation kit v2 is shipped on dry ice. The kit should be stored at –20°C upon arrival.

Quality control

MicroPlex Library Preparation kit v2 is functionally tested using Next-Generation Sequencing (NGS) to ensure product quality and consistency.

Safety information

Follow standard laboratory safety procedures and wear a suitable lab coat, protective goggles and disposable gloves to ensure personal safety as well as to limit potential cross contaminations during the sample preparation and subsequent amplification reactions.

1. Introduction

Next-Generation Sequencing (NGS) is a dynamic field with rapidly evolving needs. Regardless of sample type or application, a DNA library must be prepared from each sample in order to be sequenced on Illumina® NGS platforms. The process of library preparation (Figure 1) involves placing Illumina® sequencing adapters on DNA fragments and adding Illumina® -compatible indexes to allow pooling of multiple samples (multiplexing). This library preparation is a critical step in the NGS workflow and has direct impact on the quality of sequencing results.

Figure 1. Illumina® NGS workflow

DNA samples are first purified and sheared. Library preparation follows, consisting of repair, Illumina® adapter addition, and DNA fragment amplification. Indexed libraries are purified, pooled, and quantified prior to sequencing on Illumina® NGS platforms.

As NGS clinical applications emerge and as NGS instruments become more powerful, researchers and clinicians are increasingly investigating more difficult and challenging samples which are present in limited quantities, used in small amounts, and/or damaged. In many applications, such as cell-free DNA from plasma, the sample DNA material is limited and highly degraded. In cases where DNA is not limited, such as analysis of tumor tissues, the ability to use low input amounts is important for conserving samples for multiple uses. Clinical samples also necessitate careful tracking of samples; a protocol in which the sample never leaves the tube is advantageous to ensure accurate sample tracking and to avoid contamination. This growing trend requires library preparation kits which accurately preserve the complexity of the samples and provide higher sensitivity and greater multiplexing capability, with a simple workflow.

The commitment to fulfill these needs is the core of MicroPlex v2. It has been developed to expand multiplexing capability and provide high-quality, Illumina® -compatible NGS libraries from low input amounts. MicroPlex v2's three-step, single-tube library preparation workflow (Figure 2) is the simplest in the industry and minimizes handling errors and loss of valuable samples.

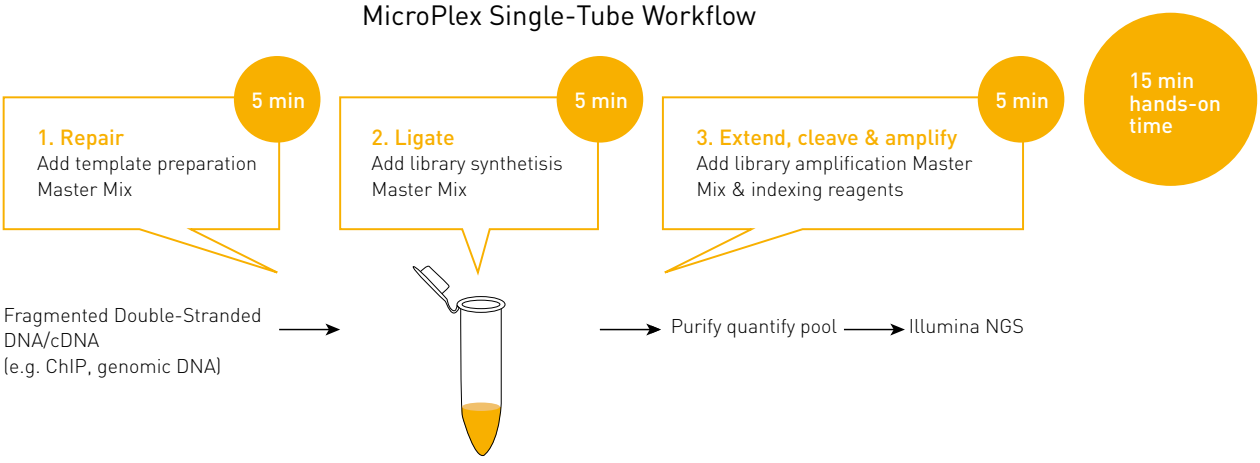

Figure 2. MicroPlex v2 single-tube library preparation workflow

The MicroPlex v2 workflow consists of 3 simple steps that take place in the same PCR tube or well and eliminates the need to purify and transfer the sample material.

2. MicroPlex Library Preparation kit v2

2.1 Overview

The MicroPlex Library Preparation kit v2 is designed to provide up to 48 indexed libraries for higher multiplexing capabilities on Illumina® NGS platforms. The MicroPlex v2 chemistry is engineered and optimized to generate DNA libraries with high molecular complexity from the lowest input amounts. Only 50 pg to 50 ng of fragmented double-stranded DNA is required for library preparation. The entire three-step workflow takes place in a single tube or well in about 2 hours. No intermediate purification steps and no sample transfers are necessary to prevent handling errors and loss of valuable samples. Providing high library diversity, MicroPlex v2 libraries excel in target enrichment performance and deliver high quality sequencing results.

The MicroPlex Library Preparation kit v2 includes all necessary reagents including indexes for multiplexing up to 48 samples. Once purified and quantified, the resulting library is ready for Illumina® NGS instruments using standard Illumina® sequencing reagents and protocols. The kit provides excellent results for high-coverage, deep sequencing such as de novo sequencing, whole genome resequencing, whole exome sequencing, and/or other enrichment techniques. It is ideally suited for use in ChIP-seq and for use with small fragments of DNA such as cell-free plasma DNA.

2.2 Principle

The MicroPlex Library Preparation kit v2 is based on the patented MicroPlex technology (Figure 3). Unlike other NGS library preparation kits, which are based on ligation of Y-adapters, MicroPlex uses stem-loop adapters to construct high quality libraries in a fast and efficient workflow. In the first step, Template Preparation, the DNA is repaired and yields molecules with blunt ends. In the next step, stem-loop adaptors with blocked 5' ends are ligated with high efficiency to the 5' end of the genomic DNA, leaving a nick at the 3' end. The adaptors cannot ligate to each other and do not have single-strand tails, both of which contribute to non-specific background found with many other NGS preparations. In the final step, the 3' ends of the genomic DNA are extended to complete library synthesis and Illumina® -compatible indexes are added through a high-fidelity amplification. Any remaining free adaptors are destroyed. Hands-on time and the risk of contamination are minimized by using a single tube and eliminating intermediate purifications.

2.3 MicroPlex v2 workflow

The MicroPlex Library Preparation kit v2 workflow is highly streamlined (Figure 3) and consists of the following three steps:

- Template Preparation for efficient repair of the fragmented double-stranded DNA input.
- Library Synthesis for ligation of patented stem-loop adapters.
- Library Amplification for extension of the template, cleavage of the stem-loop adaptors, and amplification of the library. Illumina® -compatible indexes are also introduced using a high-fidelity, highly-processive, low-bias DNA polymerase.

The three-step MicroPlex v2 workflow takes place in a single tube or well and is completed in about 2 hours.

Figure 3. MicroPlex Library Preparation kit v2 workflow overview

3. Getting Started

3.1 Additional Supplies and equipment needed

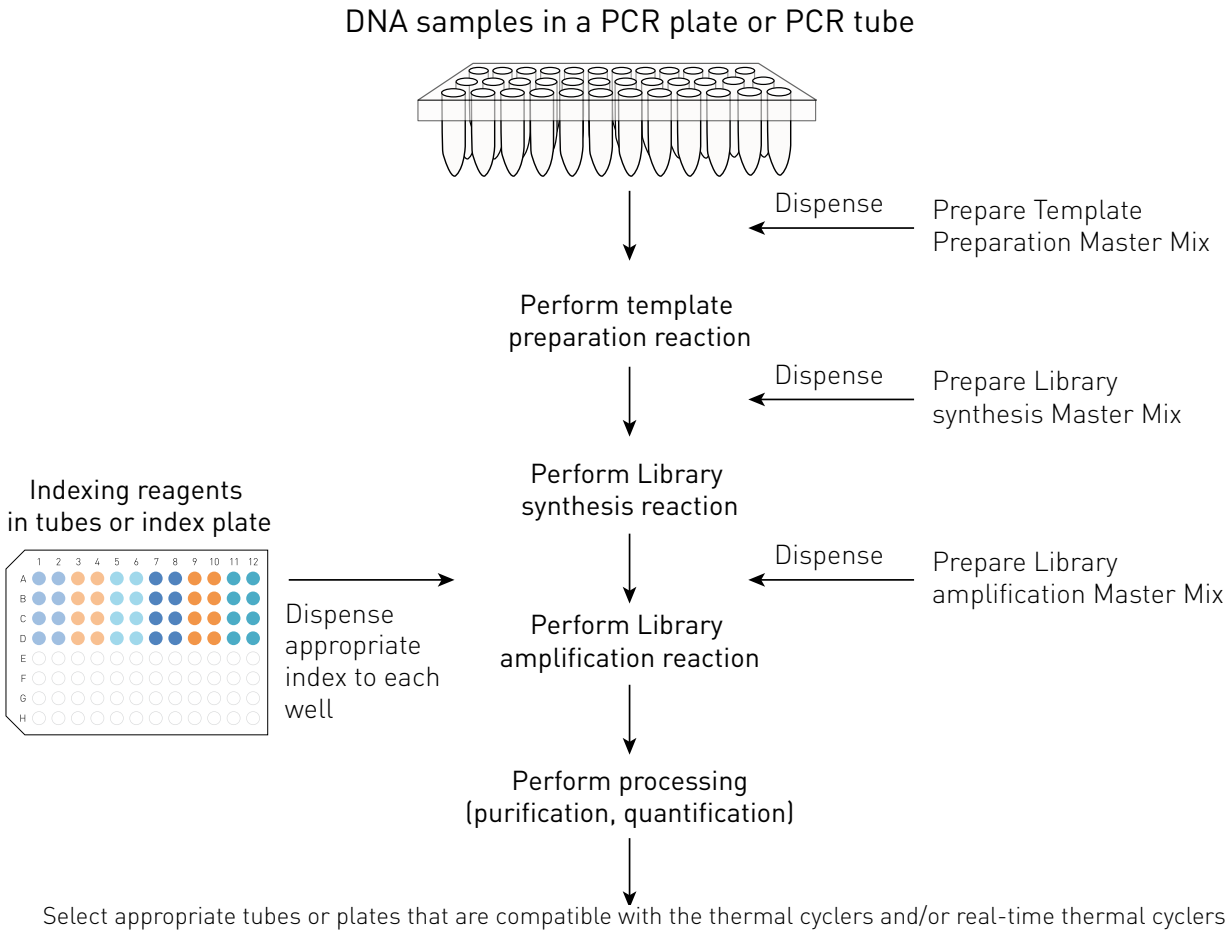
Required supplies and equipment

- Thermal cycler (real-time instrument recommended)

NOTE:
See thermal cycler considerations below.

- Centrifuge
- PCR tubes or 96-well PCR plates and seals

NOTE:



Select appropriate tubes or plates that are compatible with the thermal cyclers and/or real-time thermal cyclers used. Use appropriate caps or sealing films and seal thoroughly to eliminate evaporation during cycling conditions. Evaporation could reduce robustness and reproducibility of the reactions.

- Low binding aerosol barrier tips
- Freshly prepared 80% (v/v) ethanol
- Agencourt® AMPure® XP beads (Beckman Coulter, Cat. No. A63880)

Optional Supplies

- KAPA® Library Quantification Kit – Illumina® (Kapa Biosystems, Cat. No. specific to real time PCR system used)
- EvaGreen® Dye, 20X in water (Biotium, Cat. No. 31000-T)
- Fluorescein Calibration Dye (Bio-Rad Laboratories, Cat. No. 170-8780)

3.2 Thermal cycler considerations

Thermal cycling and heated lid

Use a thermal cycler equipped with a heated lid that can handle 50 µL reaction volumes. Set the temperature of the heated lid to 101°C – 105°C to avoid sample evaporation during incubation and cycling.

Thermal cycler ramp rates

We recommend a ramp rate of 3°C/s – 5°C/s; higher ramp rates are not recommended and could impact the quality of the library.

Monitoring amplification during the Library Amplification Reaction

Amplification can be monitored using a real-time thermal cycler with the addition of fluorescent dyes (not provided with the kit, see Optional Supplies above) to the reaction (Figure 4). If a regular thermal cycler is used instead, there is no need to add the dyes; use an appropriate amount of nuclease-free water to prepare the Library Amplification Master Mix. In

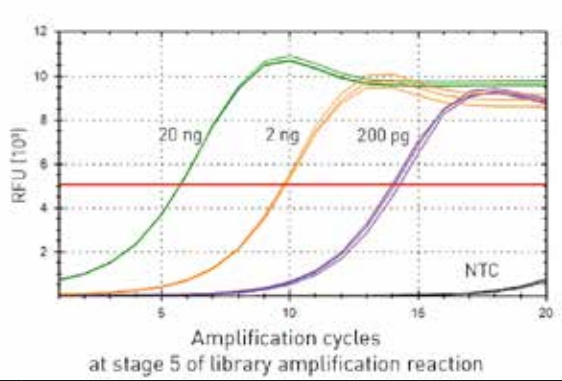
the absence of real-time monitoring, library amplification can be analyzed by gel or by analysis of an aliquot of the library using the Agilent® Bioanalyzer® (see Library Quantification, Section E.II.).
Depending on the real-time instrument used, select an appropriate calibration dye and mix with EvaGreen dye to prepare the dye mix (see Library Amplification Step, Section D.III.). For some real-time instruments, calibration dye may not be needed; please refer to the real-time thermal cycler instrument's manual.

Figure 4. Example of real-time analysis of library amplification using MicroPlex v2

A typical real-time amplification analysis of libraries prepared with MicroPlex Library Preparation kit v2 using 20 ng, 2 ng, or 200 pg of sheared human DNA (GM 10851, Coriell Institute, 200 bp) relative to a No Template Control (NTC). Results were obtained using a CFX96 Touch™ Real-Time PCR Detection System (Bio-Rad) with EvaGreen as the dye for detection and fluorescein as the calibration dye. The red line marks the midpoint of the linear phase of the amplification curves and is used to determine the optimal number of amplification cycles at Stage 5 of the Library Amplification Reaction (Section D.III.). It is recommended to stay within one cycle above or below the optimal number of cycles. For example, for a 2 ng input, the optimal number of amplification cycles is 10±1 cycles or 9 to 11 cycles. The Relative Fluorescence Unit (RFU) values on the y-axis may vary based on the instrument used.

3.3 Starting material

DNA Sample requirement	
Nucleic acid	Fragmented double-stranded DNA or cDNA
Source	Cells, plasma, urine, other biofluids, FFPE, tissues, frozen tissues
Type	Mechanically sheared; enzymatically fragmented; ChIP DNA; low molecular weight cell-free DNA



Molecular weight	‹ 1,000 bp
Input amount	50 pg to 50 ng
Input volume	10 µL
Input Buffer	≤ 10 mM Tris, ≤ 0.1 mM EDTA

DNA Format

Fragmented double-stranded DNA (gDNA or cDNA), chromatin immunoprecipitates (ChIP), degraded DNA from sources such as FFPE, plasma, or other biofluids are suitable. This kit is not for use with single-stranded DNA (ssDNA) or RNA.

Input DNA amount

Input DNA in the range of 50 pg to 50 ng can be used as starting material. For deep Whole Genome Sequencing (WGS) and Whole Exome Sequencing (WES) using human gDNA, FFPE, or plasma DNA, greater than 10 ng of input DNA is recommended to achieve a highly diverse library. For sequencing samples with reduced 10 complexity, such as cDNA, ChIP DNA, bacterial DNA, or targeted genomic regions, lower input amounts (picogram levels) can be used.

Fragment size

The optimal DNA fragment size is less than 1,000 bp. The MicroPlex Library Preparation kit v2 is a ligationbased technology and adapters added during the process result in an approximately 140 bp increase in the size of each DNA template fragment. Library molecules with shorter inserts (200 – 300 bp) tend to cluster and amplify more efficiently on the Illumina® flow cell. Depending on the application and requirements, the AMPure purification step following the final step (Library Amplification) can be replaced with a size-selection step to remove unwanted fragments.

Input volume

The maximum input sample volume is 10 µL. If a sample is in a larger volume, the DNA must be concentrated into 10 µL or less. Alternatively, the sample may be split into 10 µL aliquots, processed in separate tubes, and the corresponding products pooled prior to the purification step preceding sequencing.

Input buffer

Input DNA must be eluted or resuspended in a low-salt and low-EDTA buffered solution. The preferred buffer is low TE (10 mM Tris, 0.1 mM EDTA, pH 8.0). The concentrations of Tris and EDTA must not exceed 10 mM and 0.1 mM, respectively. Avoid phosphate containing buffers.

3.4 Positive and Negative Controls

If necessary, include appropriate positive and negative controls in the experimental design to help verify that reactions proceed as expected. If the experimental samples contain any carryover contaminant(s) in the buffer, the downstream reactions may be impacted, and inclusion of controls would help elucidate such problems. A suitable positive control (reference DNA) is sheared purified genomic DNA (200 – 300 bp) of comparable input amount. Always prepare fresh dilutions of reference DNA. Include a negative control (No Template Control, NTC) with low TE buffer (10 mM Tris, 0.1 mM EDTA, pH 8.0) or nuclease-free water. The positive control and experimental samples should perform equivalently, while the NTC should not amplify.

3.5 Preparation of Master Mixes

A master mix with appropriate buffers and enzymes must be prepared at each workflow step based on the number of reactions to be performed. Transfer the enzymes to ice just prior to use and centrifuge briefly to collect contents at the bottom of the tube. Thaw the buffers, vortex briefly and centrifuge prior to use. Keep all the components and master mixes on ice. Once the master mix is prepared, thoroughly mix the contents several times with a pipette while avoiding introduction of excessive air bubbles and briefly centrifuge prior to dispensing into the PCR plate or tube(s).

3.6 Indexing reagents

MicroPlex Library Preparation kit v2 includes all necessary reagents including Indexing Reagents for multiplexing samples. The Indexing Reagents consist of amplification primers containing Illumina® -compatible indexes. Index sequences can be downloaded as CSV files at the MicroPlex v2 Product Page. Before starting the MicroPlex Library Preparation v2 Protocol (Section D), refer to Appendix I for information on index sequences, Index Plate handling instructions, and multiplexing and index pooling guidelines.

MicroPlex kit v2 (12 rxns, 12 indices)

Indexing Reagents are pre-dispensed in 12 individual tubes with blue caps. Each tube contains sufficient volume for up to 8 uses. No more than 4 freeze/thaw cycles are recommended for the Indexing Reagent Tubes.

MicroPlex kit v2 (48 rxns, 48 indices)

Indexing Reagents are pre-dispensed and sealed in a linear barcoded Index Plate. The Index Plate is sealed with foil that can be pierced with a multichannel pipet tip to collect the required amount of index to assemble the reactions. Each well of the Index Plate contains sufficient volume for a single use. No more than 4 freeze/thaw cycles are recommended for the Index Plate.

3.7 Using Illumina® Experiment Manager

Make sure the latest version of the Illumina® Experiment Manager (IEM) is installed (version 1.8 or later). Prior to starting the MicroPlex Library Preparation kit v2 Protocol (Section D), create a Sample Sheet in the IEM to select and validate appropriate indexes to use in your experiments. Refer to Appendix 1 for guidelines on using the IEM to validate your index combinations.

3.8 Target Enrichment

MicroPlex v2 is compatible with the major exome and target enrichment products, including Agilent SureSelect®, Roche NimbleGen® SeqCap® EZ and custom panels.

4. MicroPlex Library Preparation kit v2 Protocol

4.1 Template Preparation Step

Template Preparation Reagents

Template Preparation Reagents	
Reagent	**Cap color**
Template Preparation Buffer	Red
Template Preparation Enzyme	Red

NOTE:
Assemble all reactions in thin wall 96-well PCR plates or PCR tube(s) that are compatible with the thermal cycler and or real-time thermal cycler used.

Template Preparation Protocol

- Prepare samples as described below.

→ Samples: Dispense 10 µL of fragmented doubled-stranded DNA into each PCR tube or well of a PCR plate.

→ Positive control reactions using reference DNA: If necessary, assemble reactions using 10 µL of a reference gDNA (e.g., fragmented DNA, 200-300 bp average size) at an input amount comparable to that of the samples.

→ Negative control reactions/No Template Controls (NTCs): If necessary, assemble NTCs with 10 µL of nuclease-free water or TE buffer (e.g., 10 mM Tris, 0.1 mM EDTA, pH 8.0).

NOTE:
The maximum volume of DNA cannot exceed 10 µL.

- Prepare Template Preparation Master Mix as described in the table below for the desired number of reactions. Mix thoroughly with a pipette. Keep on ice until used.

Template Preparation Master Mix		
Component	**Cap color**	**Volume/Reaction**
Template Preparation Buffer	Red	2.0 µL
Template Preparation Enzyme	Red	1.0 µL

- Assemble the Template Preparation Reactions Mixture as shown in the table below. To each 10 µL sample from step 1 above, add 3 µL of the Template Preparation Master Mix.

Template Preparation Reaction Mixture	
Component	**Volume/Reaction**
Template Preparation Buffer	2.0 µL
Template Preparation Enzyme	1.0 µL

- Mix thoroughly with a pipette
- Seal the PCR plate using an appropriate sealing film or tightly cap the tube(s).Centrifuge briefly to ensure the entire volume of the reaction is collected at the bottom of each well.
- Place the plate or tube(s) in a thermal cycler with heated lid set to 101°C – 105°C. Perform the **Template Preparation Reaction** using the conditions in the table below:

Template Preparation reaction	
Temperature	**Time**
22°C	25 min
55°C	20 min
4°C	Hold for ≤ 2 hours

- After the thermal cycler reaches 4°C, remove the plate or tube(s) and centrifuge briefly.
- Proceed to the Library Synthesis Step.

NOTE:
Following the Template Preparation Step, continue to Library Synthesis Step in the same plate or tube(s).

4.2 Library Synthesis Step

Library Synthesis Reagents

Library Synthesis Reagents	
Reagent	**Cap color**
Library Synthesis Buffer	Yellow
Library Synthesis Enzyme	Yellow

Library Synthesis Protocol

- Prepare Library Synthesis Master Mix as described in the table below for the desired number of reactions. Mix thoroughly with a pipette. Keep on ice until used.

Library Synthesis Master Mix		
Component	**Cap color**	**Volume/Reaction**
Library Synthesis Buffer	Yellow	1.0 µL
Library Synthesis Enzyme	Yellow	1.0 µL

- Remove the seal on the plate or open the tube(s).
- Assemble the **Library Synthesis Reaction Mixture** as shown in the table below. To each well or tube, add 2 µL of the **Library Synthesis Master Mix**.

Library Synthesis Reaction Mixture	
Component	**Volume/Reaction**
Template Preparation Reaction Product	13 µL
Library Synthesis Master Mix	2 µL
Total Volume	**15 µL**

- Mix thoroughly with a pipette.
- Seal the PCR plate using an appropriate sealing film or tightly cap the tube(s).
- Centrifuge briefly to collect the contents to the bottom of each well or tube.
- Return the plate or tube(s) to the thermal cycler with heated lid set to 101°C – 105°C. Perform **Library Synthesis Reaction** using the cycling conditions in the table below:

Library Synthesis Reaction	
Temperature	**Time**
22°C	40 min
4°C	Hold for ≤ 30 min

- After the thermal cycler reaches 4°C remove the plate or tube(s) and centrifuge briefly.
- Continue to the Library Amplification Step.

NOTE:
Following the Library Synthesis step, continue Library Amplification Reaction in the same plate or tube(s) maintained at 4°C.

4.3 Library Amplification Step

Multiple stages occur during the **Library Amplification Reaction** (see table in step 8 below). Stage 1 and Stage 2 extend and cleave the stem loop adapters. **Proper programming of the thermal cycler is critical for these steps to be completed correctly, with no denaturation step until Stage 3**. Illumina® - compatible indexes are incorporated into the template library in Stage 4 using 4 amplification cycles. In Stage 5, the resulting template is amplified; the number of cycles required at this stage is dependent on the amount of input DNA used. Samples are cooled to 4°C in Stage 6, after which they are pooled and purified or stored at –20°C.

NOTE:
Refer to **Appendix 1** for selecting the appropriate indexes to use for your experiments.
Selection of the optimal number of cycles for library amplification (Stage 5 ▲): The number of PCR cycles required at Stage 5 of the Library Amplification Reaction is dependent on the amount of input DNA and thermal cycler used. Use the table below as a guide for selecting the number of PCR cycles.

▲ Stage 5 Amplification Guide	
DNA Input (ng)	**Number of Cycles**
50	5
20	6
10	7
5	8
2	10
1	11
0.2	14
0.05	16

Optimization experiment

Performing an optimization experiment to identify the appropriate number of PCR cycles needed is recommended. Use the desired amount of input DNA and allow the library amplification reaction to reach plateau. Determine the optimal number of amplification cycles by constructing PCR curves and identifying the midpoint of the linear phase as illustrated in Figure 5. Use the optimal amplification cycle number in the actual experiment for sequencing.

Yield

The amount of amplified library can range from 100 ng to 1 µg depending upon many variables including sample type, fragmentation size, and thermal cycler used. When starting with fragmented reference DNA with an average size of 200 bp and following the recommended number of amplification cycles, the typical yields range from 300 ng to 700 ng.

NOTE:
Over amplification could result in higher rate of PCR duplicates in the library.

Library Amplification Reagents

Library Synthesis Reagents	
Reagent	**Cap color**
Library Amplification Buffer	Green
Library Amplification Enzyme	Green
Nuclease-Free Water	Clear
Fluorescent Dyes	
Indexing Reagents	Tubes (Blue) or Index Plate

NOTE:
It is critical to handle the Index Plate following the provided instructions to avoid cross contamination of indexes. If the entire Index Plate will not be used, please refer to **Appendix 1** for Index Plate handling instructions.

No more than 4 freeze/thaw cycles are recommended for the Index Plate.

Library Amplification Protocol

- Prepare the Indexing Reagents
  - Remove the Indexing Reagents from freezer and thaw for ten minutes on the bench top.
  - Spin the Indexing Reagents in a table top centrifuge to collect contents at the bottom of the well.
  - Thoroughly wipe the Indexing Reagent Tubes or Index Plate foil seal with 70% ethanol and allow it to dry.
- Prepare the **Library Amplification Master Mix** as described in the table below for the desired number of reactions. Mix thoroughly with a pipette. Keep on ice until used.

Library Amplification Master Mix		
Component	**Cap color**	**Volume/Reaction**
Library Amplification Buffer	Green	25.0 µL
Library Amplification Enzyme	Green	1.0 µL
Nuclease-Free Water (plus fluorescent dyes*)	Green	4.0 µL

If monitoring in real-time:

Fluorescence dyes* (for detection and optical calibration) are added when monitoring amplification in real time during cycling. Please refer to the real-time PCR instrument's user manual for calibration dye recommendations. The volume of detection and calibration dyes plus nucleasefree water should not exceed 4 µL.

- Example: Mix 90 µl of 20X EvaGreen dye (Biotium, Cat. No. 31000-T, EvaGreen Dye, 20X in water) with 10 µL of 1:500 dilution of Fluorescein (Bio-Rad Laboratories, Cat. No. 170-8780, Fluorescein Calibration Dye). Add 2.5 µL of this mix and 1.5 µL of nuclease-free water per reaction to prepare the Library Amplification Master Mix.

If not monitoring in real-time:

If a regular thermal cycler is used, there is no need to add the dyes; use 4 µL of nuclease-free water per reaction in the Library Amplification Master Mix.

- Remove the seal on the PCR plate or open the tube(s)
- Add 30 µL of the **Library Amplification Master Mix** to each well or tube.
- Add 5 µL of the appropriate Indexing Reagent to each well or tube:

Library Amplification Master Mix	
Component	**Volume/Reaction**
Library Synthesis Reaction Product	15 µL
Library Amplification Master Mix	30 µL
Indexing Reagent	5 µL
Total Volume	**50 µL**

For MicroPlex Library Preparation kit V2 (48 rxns, 48 indices) containing Index Plate:

- Make sure the two corner notches of the Index Plate are on the left and the barcode label on the long side of the Index Plate is facing you.
- Use a clean pipet tip to pierce the seal above the specific Indexing Reagent on the Index Plate; discard the tip used for piercing.
- Use a clean pipet tip to collect 5 µL of the Indexing Reagent and add to the reaction mixture.

NOTE:

Follow the Index Plate handling instructions in Appendix 1 to avoid cross contamination.
Mix thoroughly with a pipette. Avoid introducing excessive air bubbles.

- Seal the PCR plate or tube(s) tightly and centrifuge briefly to collect the contents to the bottom of each well or tube.

NOTE:

Use optical sealing tape if a real-time thermal cycler is used.

- Return the plate or tube(s) to the real-time PCR thermal cycler/thermal cycler with heated lid set to 101°C – 105°C. Perform Library Amplification Reaction using the cycling conditions in the tables below.

CAUTION:

Ensure that the thermal cycler does not have a denaturing step programmed until Stage 3.

Library Amplification Reaction				
	Stage	Temperature	Time	Number of Cycles
Extension & Cleavage	1	72°C	3 min	1
	2	85°C	2 min	1
Denaturation	3	98°C	2 min	1
Addition of Indexes	4	98°C	20 s	4
		67°C	20 s	
		72°C	40 s	
Library Amplification	▲ 5	98°C	20 s	▲ 5 to16 (see table on right)
		*72°C	50 s	
	6	4°C	Hold	1
*Acquire fluorescence data at this step, if monitoring amplification in real-time.				

▲ Stage 5 Amplification Guide	
DNA Input (ng)	Number of Cycles
50	5
20	6
10	7
5	8
2	10
1	11
0.2	14
0.05	16

- Remove the PCR plate or tube(s) from the thermal cycler and centrifuge briefly to collect the contents to the bottom of each well.

NOTE:
At this stage, samples can be processed for next generation sequencing (NGS) immediately or stored frozen at –20°C for later processing. For instructions and recommendations on library pooling, purification, quantification, and sequencing, please refer to Section E.

5. Library Processing for Illumina® Next Generation Sequencing

5.1 Overview

This section contains guidelines for processing MicroPlex v2 libraries for Illumina® NGS. In some cases, recommended protocols are listed (Library Purification by AMPure XP beads) while in others, general guidelines are given. For more information, contact technical support at techsupport@diagenode.com.

Libraries prepared from each sample will contain the specific indexes selected at the time of the amplification. Follow the recommended workflow (solid arrows) in Figure 5 to process the libraries for Illumina® NGS. Alternative workflow paths (dashed arrows) may be followed as needed. If libraries are prepared from similar samples with equivalent input amounts, then an equal volume of each individual uniquely indexed library can be pooled into one tube for further processing. This "pooled" library is then purified using AMPure XP to remove unincorporated primers and other reagents. Once purified, the library should be quantified accurately prior to NGS to ensure efficient clustering on the Illumina® flowcell. Instructions and recommendations on library pooling, purification, quantification, and sequencing are described in the following sections.

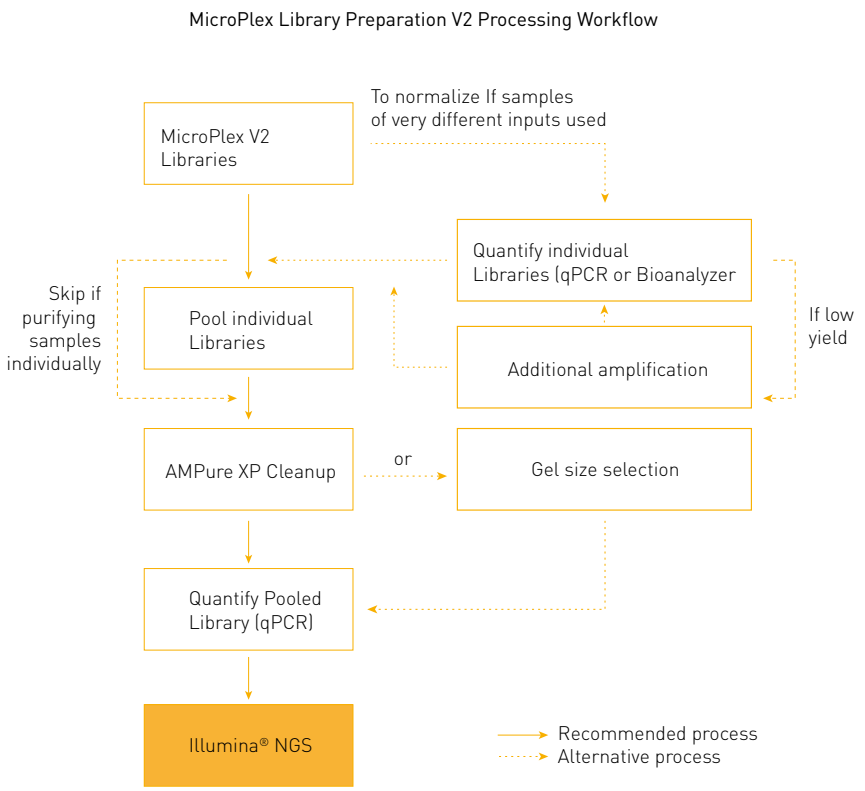


Figure 5. Workflow for processing the MicroPlex v2 amplified libraries for Illumina® NGS

5.2 Library Quantification

There are several approaches available for library quantification including real-time PCR, UV absorption, fluorescence detection, or sizing and quantification using the Agilent Bioanalyzer. It is important to understand the benefits and limitations of each approach. Real-time PCR-based approaches (such as the KAPA Library Quantification Kit from Kapa Biosystems) quantify the library molecules that carry the Illumina® adapter sequences on both ends and, therefore reflect the quantity of the clustering competent library molecules. This approach assumes a relatively uniform size of sheared or fragmented starting gDNA inserts used for library construction.

On the other hand, UV absorption/fluorescence detection-based methods (i.e., Nanodrop® (Thermo Scientific), Qubit® 2.0 Fluorometer (Life Technologies), or Quant-iT™ PicoGreen® dsDNA Assay Kit (Life Technologies)) simply quantify total nucleic acid concentration. These methods do not discriminate adapter presence and offer no information about the size of the library molecules. The Agilent Bioanalyzer system provides sizing and quantitation information about the library analyzed, but not about the clustering competency.

Quantify MicroPlex v2 library by real-time qPCR

Use the appropriate instrument-specific KAPA Library Quantification Kit for Illumina® Sequencing Platforms (Kapa Biosystems). Dilute 2 – 5 µL of the library using a 100,000-fold dilution and use this as the template for quantification. Since the adapters result in an approximately 140 bp increase in the DNA fragment size, adjust the length accordingly to calculate the concentration of your library. For example, for a 200 bp DNA input, and taking into account the distribution of fragment size, it is recommended to use 300 bp as the approximate size for calculating library concentration.

NOTE:
No purification of the template is necessary prior to qPCR due to the large dilution factor.
Quantify MicroPlex v2 library using the Bioanalyzer Remove an aliquot of each library and dilute as appropriate in TE buffer. Load a 1µL aliquot of this diluted sample onto a Bioanalyzer high sensitivity DNA chip (Agilent Technologies, Cat. No. 5067-4626).

5.3 Additional Amplification

If the results show less than desirable yield, the remaining library can be further amplified to attain a higher yield (unless a plateau has been reached). The additional amplification can only be performed on unpurified libraries. MicroPlex v2 libraries can be further amplified with no extra reagents added after storage at 4°C for up to 6 hours or –20°C for up to 7 days. To perform this additional amplification, spin down a tube or plate containing the library, transfer it to a thermal cycler, and perform 2 – 3 PCR cycles as follows:

Number of Cycles	Temperature	Time
2 – 3 cycles	98°C	20 s
	72°C	50 s
1 cycle	4°C	Hold

5.4 Library Pooling for Purification

Individual MicroPlex v2 libraries containing different indexes can be pooled at desired molar ratios to allow multiplex sequencing of the pooled library. If libraries are prepared from similar input amounts, they can be pooled by combining equal volume aliquots of each library, each containing a unique index or index combination.

Typically, a 10 µL aliquot from each library is adequate and the remainder of the library can be stored at –20°C.
The total volume obtained at the end of pooling will vary depending on the number of libraries pooled. For example, if 12 libraries are pooled, then the final volume of the pool is 120 µL; if 48 libraries are pooled, then the volume is 480 µL. A 100 µL aliquot of this pooled library is sufficient for AMPure XP purification purposes.

Illumina® sequencers use a green laser to sequence G/T nucleotides and a red laser to sequence A/C nucleotides. At each sequencing cycle of the index read, at least one of the two nucleotides for each color channel should be present to ensure proper image registration and accurate demultiplexing of pooled samples. Color balance for each base is maintained by selecting index combinations that display this green/red channel diversity at each cycle. Please see Appendix I for guidelines on selecting the appropriate indexes for pooling and multiplexing.

5.5 Library Purification by AMPure XP beads

NOTE:
AMPure XP purification is not necessary if gel size-selection is performed.

AMPure XP is the recommended method of library purification. Do not use QIAquick® cleanup or other silicabased filters for purification as this will result in incomplete removal of primers.
The ratio of AMPure XP beads to library DNA will determine the size-selection characteristics of the library.
The ratio is also application dependent. For most NGS-based applications, a 1:1 bead to sample ratio is recommended. For more information please refer to the vendor's recommendations on AMPure XP protocols for DNA purification.

Library purification reagents (supplied by the user)

Library Purification Reagents
AMPure XP beads
Magnetic rack for 1.5 mL centrifuge tubes
Freshly prepared 80% (v/v) ethanol
TE buffer, pH 8.0

AMPure XP Protocol

NOTE:

- It is important to bring all the samples and reagents to be used to room temperature.
- Always use freshly prepared 80% (v/v) ethanol for Step 3 and Step 4 below.
- Resuspend the AMPure XP reagent by gentle vortexing until no visible pellet is present at the bottom of the container.

AMPure XP Protocol (Continued)

- In a 1.5 mL tube, mix 100 µL of AMPure XP reagent with a 100 µL aliquot of the pooled library ensuring a 1:1 (v/v) ratio. Mix by pipette 10 times to achieve a homogeneous solution and incubate the tube at room temperature for 5 min.
- Pulse-spin the sample(s) on a bench top centrifuge and place the tube in a magnetic stand. Wait for 2 min or until the beads are completely bound to the side of the tube(s) and the solution is clear.
- With the tube(s) in the magnetic stand and without disturbing the pellet use a pipette to aspirate off and discard the supernatant. Add 300 µL of 80% (v/v) ethanol to the pellet.
- With the tube(s) in the magnetic stand, rotate each tube 90 degrees; wait until all the beads come to a halt. (DO NOT INVERT TUBE-RACK). Repeat this step three more times. Without disturbing the pellet, use a pipette to aspirate off and discard the supernatant. Add 300 µL of 80% (v/v) ethanol to the pellet.
- With the tube(s) in the magnetic stand and without disturbing the pellet, turn each tube 90 degrees and wait until all the beads come to a halt. (DO NOT INVERT TUBE-RACK). Repeat this step three more times. Without disturbing the pellet, use a pipette to aspirate off and discard the supernatant.
- Pulse-spin the sample(s) using a low speed, bench top centrifuge, place into a magnetic stand, and wait for 2 minutes or until the beads are completely bound to the side of the tube(s). With the tube(s) in the magnetic stand, use a pipette to aspirate off and discard any residual ethanol without disturbing the pellet.
- Leaving the cap open, incubate the sample(s) in a heating block at 37°C for 2 – 3 min or until the pellet is dry. DO NOT OVER DRY THE PELLET(S).
- Elute the DNA by re-suspending the beads with 50 µL of 1x TE buffer, pH 8.0. Pulse-spin the sample(s) using a low speed, bench top centrifuge and place it into a magnetic stand and let the beads bind to the side of the tube(s) completely (for ~2 min) until the solution is clear.
- While keeping the sample(s) in the magnetic stand, without disturbing the pellet, transfer the supernatant with a pipette into a new tube. If not used immediately, the purified library can be stored at –20 °C.

5.6 Library Purification by Gel Size-Selection (Alternate)

NOTE:
Gel size-selection is not necessary if AMPure XP purification is performed.
MicroPlex v2 libraries can be size-selected prior to sequencing using agarose gel electrophoresis as described in the Illumina® Paired-End Sample Preparation Guide (Illumina® , Part # 1005063 Rev. E, 2011), Illumina® TruSeq® DNA Sample Preparation Guide (Illumina® , Part # 15026486 Rev. C, 2012), or by using automated platforms such as LabChip® (Caliper Life Sciences), Pippin Prep™ (Sage Science), or a similar technology.
When using agarose gel electrophoresis, extraction of the DNA should be performed with QIAquick Gel Extraction Kit (Qiagen, Cat. No. 28704), or MinElute® Gel Extraction Kit (Qiagen, Cat. No. 28604) following the manufacturer's instructions.

NOTE:
The adapters added during the MicroPlex Library Preparation kit v2 process result in an approximately 140 base pair increase in the size of each library.

5.7 Sequencing Recommendations

The MicroPlex Library Preparation kit v2 generates libraries which are ready for cluster amplification and sequencing on Illumina® NGS platforms using standard Illumina® reagents and protocols for multiplexed libraries. Libraries prepared using the MicroPlex Library Preparation kit v2 result in a size distribution of library fragments that is dependent on the input DNA fragment size (Figure 6). To achieve optimal cluster density on the Illumina® flow cell, it is important to adjust the DNA concentration used for clustering based on these preferences. For example, for sequencing on the Illumina® MiSeq®, v3, load 14 – 15 pM of MicroPlex v2 libraries with an average size of 300 bp.

Illumina® recommends adding 1% PhiX control for most libraries. For low diversity libraries and if experiencing sequencing issues, increase the PhiX control spike-in to at least 5%. PhiX is a small genome that can be quickly aligned to calculate error rates. It provides a balanced and diverse library to prevent sequencing problems.

For sequencing on the HiSeq, please refer to Illumina® 's technical note Using a PhiX Control for HiSeq® Sequencing Runs (Illumina® , Pub. No. 770-2011-041). For sequencing on the MiSeq, instructions for preparing a PhiX control can be found in Illumina® 's guide on Preparing Libraries for Sequencing on the MiSeq (Illumina®, Part # 15039740 Rev. D, 2013).

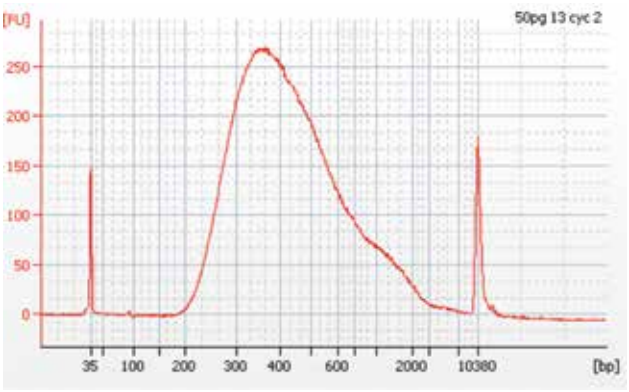

Figure 6. Bioanalyzer analysis of libraries prepared using MicroPlex v2
Libraries were prepared from 50 pg DNA (200 bp) using the MicroPlex Library Preparation kit v2. Following library amplification, an aliquot of each library was diluted at 1:4 in TE buffer, and 1µL of this diluted sample was loaded onto a Bioanalyzer high sensitivity DNA chip (Agilent Technologies). Subsequent AMPure XP purification step would remove fragments around and below 100 bp.

Appendix 1. Indexing Reagents

1. Overview

MicroPlex Library Preparation kit v2 contains all necessary reagents to generate amplified and indexed NGS libraries, including Indexing Reagents for multiplexing up to 96 samples. Table 3 below summarizes the characteristics of the included Indexing Reagents, which consist of amplification primers containing Illumina® - compatible indexes. Indexing Reagents should be stored at –20°C and should not be subjected to more than 4 freeze/thaw cycles.

NOTE:
Indexing Reagents provided with MicroPlex Library Preparation kit v2 cannot be substituted with indexing reagents from any other sources.

Table 2: MicroPlex Library Preparation kit v2 – Indexing Reagents

	12 rxns (12 indices)	48 rxns (48 indices)
Number of Reactions	12	48
Number of Indexes	12	48
Index Type	Single	Single
Length of Indexes	8nt	8nt
Format	12 Tubes	96-Well Plate
Number of Uses	Up to 8	Single
Illumina® Experiment Manager Kit Selection	TruSeq LT or Manual Input	Manual Input only

When libraries with **less than the full** set of MicroPlex v2 indexes will be prepared and pooled, it is critical that compatible index combinations are used to fulfill Illumina® requirements. Illumina® sequencers use a green laser to sequence G/T nucleotides and a red laser to sequence A/C nucleotides. At each sequencing cycle of the index read, at least one of the two nucleotides for each colored laser should be present to ensure proper image registration and ensure accurate demultiplexing of the pooled samples.

Follow the steps below before beginning the MicroPlex Library Preparation v2 Protocol if using less than the full set of indexes included with the kit:

- Determine the number of libraries that will be pooled for sequencing.
- Select the appropriate index combinations for multiplexing and pooling.
- Use the Illumina® Experiment Manager (IEM) to create a Sample Sheet which will be used during the sequencing run. The IEM can detect and warn of sub-optimal index combinations, allowing re-design before library preparation starts.

Appendices 1B to 1D provide index sequences, plate handling instructions, multiplexing and index pooling guidelines, and Sample Sheet setup instructions specific for each MicroPlex Library Preparation kit v2.

- For MicroPlex v2 12 rxns, 12 indices, proceed to point 2.
- For MicroPlex v2 48 rxns, 48 indices, proceed to point 3.

2. MicroPlex Library Preparation kit v2 x12 (12 indices)

Single Index Sequences

MicroPlex v2 single indexes use Illumina® -compatible 8nt sequences developed by the Wellcome Trust Sanger Institute in Cambridge, UK. Each Indexing Reagent Tube contains a unique single index sequence. The 12 MicroPlex v2 single indexes share the same sequences in the first 6 bases as the Illumina® TruSeq LT indexes AD001 through AD012 (Figure 8). The prepared library has the structure shown in Figure 9.

NOTE:
Information about the Sanger index sequences can be found in Nature Methods 7, 111-118 (2010).

MicroPlex v2 x12 (12 indices)				
Tube	Sanger Tag	Sequence	TruSeq LT Index	TruSeq LT Sequence
1	iPCRtagT1	ATCACGTT	AD001	ATCACG
2	iPCRtagT2	CGATGTTT	AD002	CGATGT
3	iPCRtagT3	TTAGGCAT	AD003	TTAGGC
4	iPCRtagT4	TGACCACT	AD004	TGACCA
5	iPCRtagT5	ACAGTGGT	AD005	ACAGTG
6	iPCRtagT6	GCCAATGT	AD006	GCCAAT
7	iPCRtagT7	CAGATCTG	AD007	CAGATC
8	iPCRtagT8	ACTTGATG	AD008	ACTTGA
9	iPCRtagT9	GATCAGCG	AD009	GATCAG
10	iPCRtagT10	TAGCTTGT	AD0010	TAGCTT

Libraries prepared from the MicroPlex Library Preparation kit v2 contain the 8nt Sanger index sequence on the 3' end.

Multiplexing and Index Pooling

It is very important to select appropriate single indexes such that they are unique and meet the Illumina® recommended compatibility requirements. In general, to ensure proper image registration on the sequencer, any low-plex combination should include Indexing Reagent Tube 6 (iPCRtagT6) and Indexing Reagent Tube 12 (iPCRtagT12); these correspond to the Illumina® TruSeq LT indexes AD006 and AD012. For additional lowplex (2- to 11-plex) pooling guidelines, please refer to Illumina® 's TruSeq Sample Preparation Pooling Guide (Illumina® , Part # 15042173 Rev B, 2014).

NOTE:
For MiSeq RTA v1.17.28 and later, base pair diversity of indexes is no longer checked by IEM because low-plexity index reads can be processed for all applications; any combination of indexes can be pooled for sequencing on MiSeq.

Sample Sheet Setup

The Illumina® Experiment Manager (IEM) is a desktop tool that allows you to create and edit Sample Sheets for Illumina® sequencers. To use this tool with MicroPlex indexes, ensure that the latest version of IEM (version 1.8 or later) is installed. There are two options for creating the Sample Sheet:

Option 1: In the IEM, on the "Workflow Parameters" page, select "TruSeq LT" in the dropdown menu for "Sample Prep Kit". Add indexes to be used on the "Sample Selection" page by clicking "Add Blank Row" and then choosing the appropriate indexes from the "index 1 (I7)" dropdown menu.

NOTE:

If TruSeq LT is selected, index combinations may be validated using the IEM; however, only the first 6 bases of the 8nt sequence will be sequenced. Option 2: Manually copy and paste the appropriate 8nt single index sequences to be used to the CSV file of the Sample Sheet.

The 8nt single index sequences can be downloaded as a CSV file at the MicroPlex v2 Product Page.

NOTE:

The IEM will not check for color-balanced index combinations when index sequences are entered manually from the CSV file.

3. MicroPlex Library Preparation kit v2 x48 (48 indices)

Single Index Sequences

MicroPlex v2 single indexes use Illumina® -compatible 8nt sequences developed by the Wellcome Trust Sanger Institute in Cambridge, UK. Each well of the Single Index Plate (SIP) contains a unique single index sequence (Figure 10). The first 12 MicroPlex v2 single indexes (wells A1 through A12) share the same sequences in the first 6 bases as the Illumina® TruSeq LT indexes AD001 through AD012 (sequences provided in Appendix 1B). The prepared library has the structure shown in Figure 11.

NOTE:

Information about the Sanger index sequences can be found in *Nature Methods* 7, 111-118 (2010).

MicroPlex v2 x48 (48 indices)					
Well	**Sanger Tag**	**Sequence**	**Well**	**Sanger Tag**	**Sequence**

Libraries prepared from the MicroPlex Library Preparation kit v2 contain the 8nt Sanger index on the 3' end.

Plate Handling Instructions for Low Throughput Applications

MicroPlex v2 48S Kit is designed for high throughput applications; therefore, the experiment should be designed to pool and sequence the full set of 48 libraries using the entire plate of Indexing Reagents. If Indexing Reagents from the entire plate are not used at the same time, it is critical to follow the instructions below to avoid cross contamination:

- After removing Indexing Reagents of choice, cover any pierced or used index wells with scientific tape (e.g., VWR, Cat. No. 89097-920, General-Purpose Laboratory Labeling Tape, 0.5").
- Thoroughly wipe the seal with 70% ethanol and allow it to dry completely.
- Replace the plastic lid, return the SIP to its sleeve and store at –20°C.

The Index Plate should not be frozen and thawed more than 4 times.

Multiplexing and Index Pooling

Multiplexing and pooling less than the full set of 48 libraries is possible on the MiSeq.

NOTE:
For MiSeq RTA v1.17.28 and later, base pair diversity of indexes is no longer checked by IEM because low-plexity index reads can be processed for all applications; any combination of indexes can be pooled for sequencing on MiSeq.

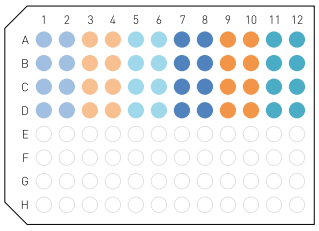

Figure 11. Single Index Plate maps with well locations
The 48S Single Index Plate contains Illumina® -compatible indexes with 8nt Sanger sequences. The colored wells indicate well positions containing Indexing Reagents.

Sample Sheet Setup

The Illumina® Experiment Manager (IEM) is a desktop tool that allows you to create and edit Sample Sheets for Illumina® sequencers. Make sure the latest version of IEM (version 1.8 or later) is installed.

Create a Sample Sheet using the IEM, then manually copy and paste the appropriate 8nt single index sequences to be used to the CSV file of the Sample Sheet.

Index sequences can be downloaded as a CSV file at the MicroPlex v2 product page.

NOTE:
The IEM will not check for color-balanced index combinations when indexes are entered manually from the CSV file.

Sample Sheet Setup

The Illumina® Experiment Manager (IEM) is a desktop tool that allows you to create and edit Sample Sheets for Illumina® sequencers. Index combinations may be validated using the IEM, which notifies user when improper combinations are used. Make sure the latest version of IEM (version 1.8 or later) is installed.

In the IEM, on the "Workflow Parameters" page, select "TruSeq HT" in the dropdown menu for "Sample Prep Kit". Add indexes to be used on the "Sample Selection" page by clicking "Add Blank Row" and then choosing the appropriate indexes from the "index 1(I7)" and "index 2 (I5)" dropdown menus.

Appendix 2. Troubleshooting guide

Problem	Potential Cause	Suggested Solutions
Sample amplification curve looks like No Template Control (NTC) amplification curve or does not produce amplified product	No input DNA added	Quantitate input before using the kit
	Incorrect library template used (e.g., RNA, ssDNA)	Adhere to DNA Sample Requirements (Section C.III.)
NTC amplification curve appears early or produces a yield similar to sample reaction products	NTC contaminated with DNA	Use a fresh control sample and check all reagents; replace kit if necessary. Clean area thoroughly and use PCR-dedicated plastics and pipettes
After purification of the amplified library, Bioanalyzer traces shows multiple peaks besides the markers	Input sample contains unevenly fragmented DNA of various sizes (e.g., plasma DNA)	If possible, quantify and check input DNA prior to using the kit. Sequencing is still recommended.
After purification of the amplified library, Bioanalyzer traces shows broad peak(s) extending from less than 1,000 bp to greater than 1,000 bp	Library over-amplified or Bioanalyzer chip overloaded (common for high sensitivity chips)	Perform fewer PCR cycles at Stage 5 of the Library Amplification Reaction. For high sensitivity chips, load ↖ 500 pg/µL. Repeat Bioanalyzer run.
